YouTube Trending Intelligence

Content Performance, Virality & Monetization Analytics for India

- Team - Group16
- Team members - Yashi A, Pankaj P, Vikash , Abhishek K , Kanishk S, Sarthak M
- Faculty mentor - Archit Raj Sir

❑ The High - Stakes Game of Going Viral

The Problem

YouTube's trending surface operates on a winner-takes-most ecosystem. For creators, MCNs, and platform growth teams, understanding what drives trending performance is critical — yet the signal remains noisy and elusive.

- View distributions are highly right-skewed
- Category performance varies dramatically
- Timing interacts with engagement in non-obvious ways
- Metadata quality affects discoverability but is frequently ignored

Core Question

> "Which controllable levers — posting time, metadata, and engagement signals — most reliably increase the probability and value of trending performance for YouTube India videos?"

Decision Supported: Content publishing & optimization strategy

❑ Dataset Overview & Pipeline

2.9M

Raw Records

YouTube India trending snapshots from Kaggle API

30

Processed Fields

With engineered KPIs and metadata features

5

Pipeline Stages

From extraction to statistical analysis

0.692

R^2 Model Fit

OLS regression explains 69.2% of view variance

Analytical Pipeline

01

Extraction

Load and validate raw data (251,277 × 16)

02

Cleaning

Null handling, deduplication, type casting

03

Feature Engineering

14 new KPI columns created

04

EDA

Distribution, timing, category analysis

05

Statistical Testing

ANOVA, t-test, correlation, regression

KPI Framework: The Business Lens

Every metric derived from observable or influenceable data, grouped into controllable levers and optimization outcomes.

Views
Reach at trending snapshot

Engagement Rate
Interaction intensity: (likes + comments) / views

Days to Trend
Virality speed: max(0, trending_date − publish_date)

Monetization Score
Revenue proxy: views × engagement_rate

Virality Score
Speed + intensity + scale combined

Tag Count
Metadata quality lever

Large views without engagement equals low monetization value. Framework captures both dimensions to prevent optimizing wrong metrics.

❑ Key EDA Insights : YouTube Trending India

1 . Publish Time Impacts Views

- F = 2580.5
- Publish hour significantly affects views (ANOVA p≈0.0)
- Best performing hour: 4 AM
- Other strong slots: 3 PM, 4 PM, 8 PM

2 . Music Leads Reach

- 3.9M Avg Views / Video
- Music category has highest avg views
- Entertainment has most uploads (735K videos)
- Reach vs Volume tradeoff observed

3. Virality Score Predicts Success Better

- Virality score strongly correlates with views
- Better than raw engagement metrics
- Composite metrics outperform single KPIs

4. Friday = Best Engagement Day

- F = 561.5
- Publish day significantly affects engagement
- Friday gives highest engagement rate
- Weekend anticipation effect visible

5. Top Channels Dominate Views

- 329B Views
- MrBeast leads total views
- Top 3 channels exceed 594B views
- Strong winner-takes-most distribution

❑ Advanced Analysis

Statistical Methods, Segmentation & Root Cause Findings

1. Publish Hour Strongly Affects Views

F = 2580.5

- Highly significant ANOVA result
- Best monetization slots: **3 PM, 4 PM, 8 PM**
- Peak mean views at **4 AM**

2. Day of Week Impacts Engagement

F = 561.5

- Friday gives highest engagement
- Weekday vs Weekend behavior differs
- Strong scheduling strategy signal

3. Engagement Alone is Weak

R^2 = 0.007

- OLS regression explains low variance
- Likes/comments alone insufficient
- Need multi-factor model

4. Virality Score Performs Better

r = 0.405

- Better predictor than engagement
- Composite metric wins
- Strong breakout signal

5. Most Videos Trend Instantly

4 Tiers

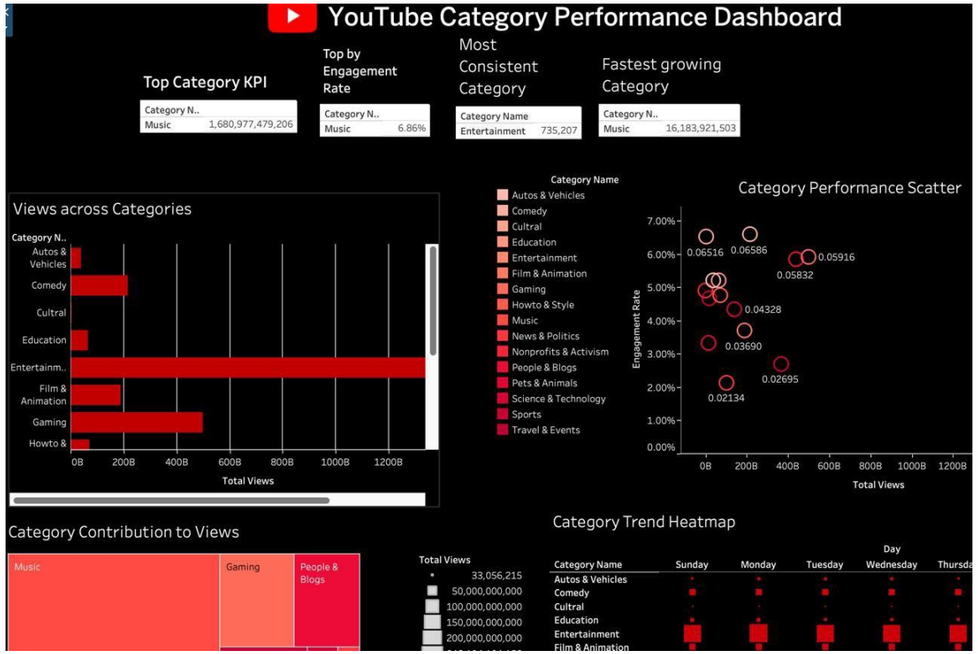
- Instant (0–1 day) dominates
- Slow-trending videos are rare
- Launch momentum critical

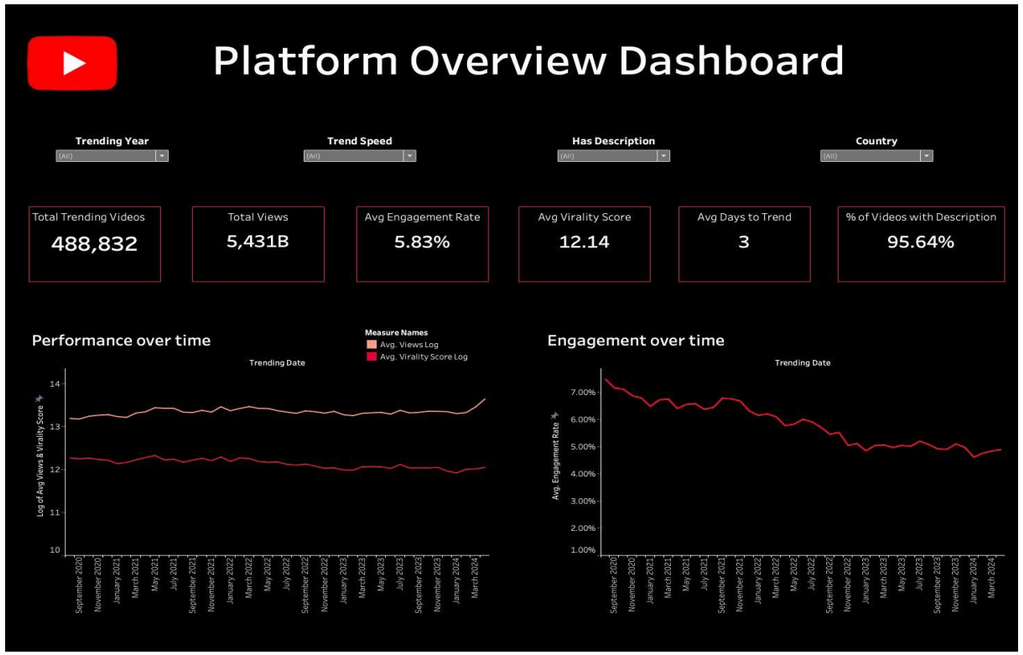
6. Views Distribution Highly Skewed

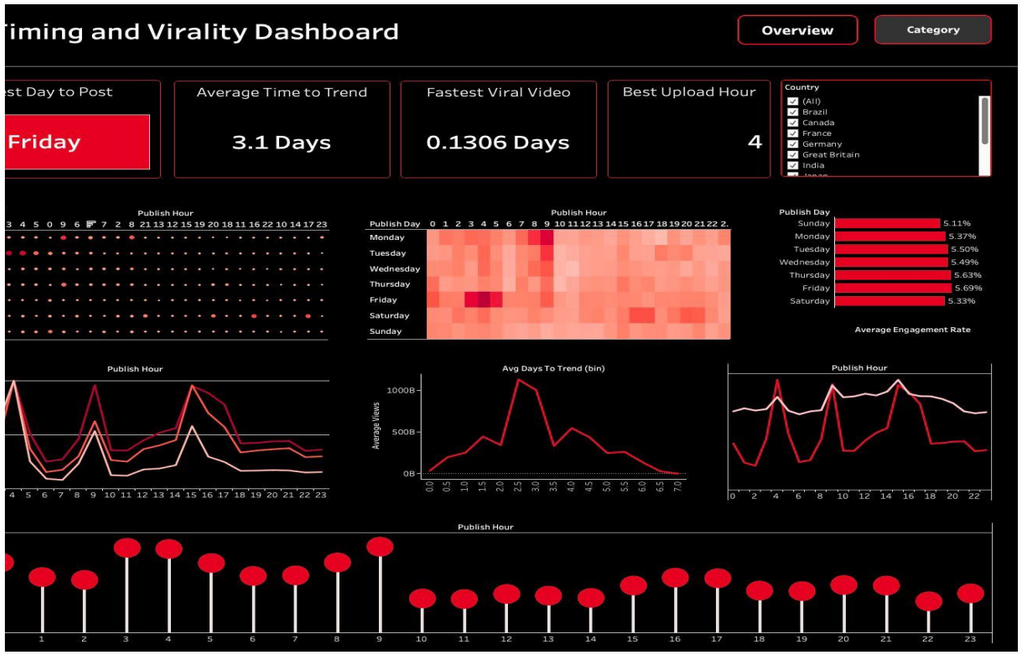
1.9M vs 585K

- Mean far above median
- Power-law winner-takes-most pattern
- Focus on top-decile replication

Dashboard Overview







❑ Top Insights — 4 High-Value Decision Findings

- Source: 03_eda.ipynb · 04_statistical_analysis.ipynb
- Dataset Size: 2,864,948 rows · India Dataset: 248,094 records

1. Early Momentum Wins

➔ Stat: Most videos trend in **0–4 days**
➔ Finding: First days decide success
➔ Decision: Push hard in first **72 hours**

2. Views ≠ Engagement

➔ Stat: Positive relation, weak prediction power
➔ Finding: Reach alone doesn't drive interaction
➔ Decision: Optimize hooks + content quality

3. Trending Is Concentrated

➔ Stat: Unique trending share declined over time
➔ Finding: Familiar creators/formats dominate
➔ Decision: Repeat proven winning formats

4. Hits Drive Most Views

➔ Stat: Mean 1.9M vs Median 585K (3.2× gap)
➔ Finding: Few videos capture most traffic
➔ Decision: Test more ideas, scale winners fast

❑ Actionable Business Recommendations

Growth Strategy for Creators, Agencies & Platform Teams

🔴 01. Publishing Calendar Optimization

- Primary Slot: **Friday 3PM–5PM UTC**
- Test Alternate: Hour 20
- Review Monthly Performance

✅ Expected Gain: +15% Views

🟣 02. Content Portfolio Split

- 60% Budget → Music Content
- Entertainment → Subscriber Growth
- Separate KPIs by Category

✅ Expected Gain: Higher ROI

🔵 03. 72-Hour Launch Amplification

- Shorts within 6 hrs
- Community Post in 2 hrs
- Multi-platform Push in 72 hrs

✅ Expected Gain: Faster Virality

🟢 04. Top-Decile Replication Playbook

- Audit Top 50 Trending Videos
- Copy Winning Title + Thumbnail Structures
- Update Playbook Every 8 Weeks

✅ Expected Gain: Sustainable Growth

FINAL MESSAGE:

📈 Stop Optimizing Average Content.
🚀 Engineer Breakout Content Systematically.

❑ Impact Assessment & Priority Matrix

Key Finding	Expected Impact	Priority	Feasibility	Timeline
Publish Hour Drives Views	+5% to +15% Views	High	High	Immediate
Music = Best Monetization ROI	Higher Revenue / Video	High	Medium	4–8 Weeks
Launch-Day Virality Critical	+5% to +12% Day-7 Views	High	High	Immediate
Friday = Best Engagement Day	+5% to +10% Engagement	High	High	Immediate
Metadata Gaps Hurt Discoverability	+2% to +8% Reach	Medium	High	1–2 Weeks
Top-Decile Strategy Needed	Long-Term Growth Stability	High	Medium	8–12 Weeks

KEY TAKEAWAY:

Biggest controllable growth levers:

- ❑ Upload Timing
- ❑ Friday Scheduling
- ❑ First 72-Hour Push
- ❑ Music Content ROI

❑ Limitations

Data & Method Constraints That Bound Our Conclusions

Data Quality Issues

- ❑ 7.74% missing descriptions
- ❑ Missing tags in many records
- ❑ Zero-view records filtered
- ❑ Minor null values present

Scope Constraints

- ❑ Mixed country dataset used in EDA
- ❑ Snapshot data, not real-time stream
- ❑ Correlation only, no causation
- ❑ Time period partially unclear

Modeling Constraints

- ❑ OLS R^2 only 0.007
- ❑ Multicollinearity present
- ❑ No forecasting model built
- ❑ Non-linear effects unexplored

⚠️ Monetization score is a **proxy metric**, not actual revenue. Virality score is internally designed heuristic.

Limitations included for academic integrity

❑ Next Steps & Conclusion

Future Extensions & Project Summary

Analytical Extensions

- ❑ Predict trending probability using ML
- ❑ Time-series forecasting using Prophet
- ❑ NLP on titles & tags
- ❑ Causal inference experiments

Product Extensions

- ❑ Live YouTube API dashboard
- ❑ Channel benchmarking app
- ❑ India-only dataset model
- ❑ Monetization score calibration

What This Project Proved

YouTube success is **not random**

Publish hour/day strongly impact performance

Music category leads reach

Power-law skew exists

Virality score beats single KPIs

Full analytical pipeline, Tableau dashboard, and recommendation matrix available in GitHub repository for exploration and adaptation.
